Switch Function

| SPDT     | 160 |

Version

| new ss-switches with metric cable gland | N |

Execution

| Standard with PA cable gland | N |
| with ss-cable gland          | S |
| with brass cable gland       | M |

This data sheet set applies to Weka type 37160/xx magnetic switches manufactured after June 2008. Switches made before this time have Blue rather than Grey conductors to common terminal of switch.
Installation Instructions
Magnetic Switches for WEKA Visual Level Indicators

Mounting Normal: Valid is the indicated switching function on the type label (float below switch)
Installation 180 °C opposite of the indication rail with the permitted tolerance according to the tube diameter
Cable exit downwards

Variation: Each of the following variants leads to a reversion of the indicated switching logic
Mounting with cable exit upwards
Mounting adjacent to the indication rail

Contact rating guidelines for Magnetic Switches

Caution:
Read this information before installing level indicators that have magnetic switches. Use of magnetic switches with inappropriate contact ratings can result in damage to the magnetic switches and malfunctioning of level indicators. For Ex rated magnetic switches (311x0-NI / -ND) it is necessary to adhere to the specified limit values of electrical parameters of the circuit.

Construction:
The key element of a Weka magnetic switch module or sub-assembly is a reed switch. A reed switch consists of two pieces of special flattened wire (the reeds or “paddles”) hermetically sealed in a glass capsule. The reed switch is actuated by the magnetic field of the float. The glass capsule is filled with a protective gas that ensures high electrical life expectancy of millions of switching cycles.

Contact rating (resistive loads):

Caution:
For many resistive load applications, the electrical circuit can have inductance and / or capacitance. Voltage spikes of 6 to 7 times the normal values can occur when switching off inductive loads. This can sometimes result in the contacts getting welded together, destroying the switch.

Examples of inductive loads are transformers, solenoid operated devices (valves, contactors), some types of wound-filament lamps, etc.

Protecting magnetic switches used with inductive loads:

**Figure 1 (D.C.)**

For D.C. applications:
A diode connected across the load coil short circuits the reverse voltage spike that occurs when the supply is switched off, thus protecting the switch contacts.

**Figure 2 (A.C.)**

For A.C. applications:
A resistor and capacitor in series connected across the switch forms a high impedance path at normal A.C. frequencies. This impedance turns low at high frequencies, diverting spikes currents from the switch.
Magnetic switch, change over, bistable
with plastic cable gland, for Australia
Type 37160-NN

External electrical connections

- Installed opposite the indication rail
- Cable exit downwards

Function

Magnetic switch for WEKA Visual Level Indicators

The switch module is attached to the float chamber, diametrically opposite the indication rail, with cable-exit below (see data sheet 20010501). The float magnet activates the reed contact when the liquid in the float chamber reaches that level. The switching logic is reversible by installing the switch module adjacent to the indication rail, or alternatively by inverting the switch module with cable-exit upwards.

Please refer to the safety guidelines.

Fixation

If ordered together with a VLI fixation is included in the delivery
If fixation is ordered separately please indicate tube diameter

- for tube diameter 30…40mm Article no. 80648
- for tube diameter 40…57mm and 57…80mm Article no. 84043

Remarks

The switch is maintenance free.
Magnetic switch, change over, bistable
for highest chemical resistance, for Australia
